I claim:

- 1. A multi-layer monofilament consisting of multiple
 2 layers that are extruded simultaneously in a single process step,
 3 having a first layer made from first plastic, a second layer,
 4 which is bonded directly to the first layer, made from a second
 5 plastic, and a third layer, which is bonded directly to the
 6 second layer, made from a third plastic wherein the second
 7 plastic is a bonding agent for bonding the first and third.
- 2. The multi-layer monofilament according to claim 1
 wherein the monofilament consists of three layers.
- 3. The multi-layer monofilament according to claim 1 wherein the monofilament has a core/sheath structure, that the core of the monofilament is formed by the first plastic, the core is at least partly enclosed by the second layer consisting of the second plastic, and the second layer consisting of the second plastic is at least partly enclosed by the third layer consisting of the third plastic.
- 4. The multi-layer monofilament according to claim 1
 wherein the monofilament has a side-by-side structure.

- 5. The multi-layer monofilament according to claim 1
 wherein the second plastic is an ethylene-vinylacetate copolymer
 or a methylacrylate copolymer.
- 6. The multi-layer monofilament according to claim 1
 wherein one of the layers to be bonded by means of the second
 plastic, is made from at least one plastic from the group which
 consists of polyethylene terephthalate (PET), polyamide (PA),
 polyamide copolymer, and polypropylene (PP).
 - 7. The multi-layer monofilament according to claim 6, the other of the two layers to be bonded by means of the second plastic is made from at least one plastic selected from the group which consists of polyethylene (PE), polyoxymethylene (POM), polyphenylene sulphide (PPS), polymethylmethacrylate (PMMA), polybutylene terephthalate (PBT), polyvinyl chloride (PVC), polyether etherketone (PEEK), and polyethylene naphthalate (PEN).
 - 8. A method of making a multilayer monofilament which comprises the steps of:

 3 spinning a liquified plastic core from a spinning
 - 4 orifice;
 - applying two to said core at least one synthetic resin bonding agent to form an inner sheath on said core as said core emerg s from said orifice; and

8	applying to said inner sheath an outer sheath of a
9	synthetic resin to which the synthetic resin of said inner sheath
10	can bond as said core passes out of said spinning orifice.

- 9. The method defined in claim 8 wherein each of said sheaths is fed to said core through an annular slit surrounding said core.
- 1 10. The method defined in claim 9 wherein the 2 monofilament formed by said core and said sheaths is stretched.
- 1 11. The method defined in claim 10 wherein the monofilament is fixed after stretching.
